

Psychology

The scientific study of mind and behavior

112

Psychology is the scientific study of the mind and behavior, exploring how people think, feel, and act individually and in social contexts.

● DEFINITION

The scientific study of the human mind and its functions, especially those affecting behavior in a given context.

● WHY IT MATTERS

Psychology informs mental health treatment, education, workplace practices, and countless other fields where understanding human behavior matters.

● WORKING PRINCIPLE

Psychologists use scientific methods — experiments, observation, and clinical assessment — to study mental processes and behavior, developing theories and interventions grounded in empirical evidence.

● QUICK FACTS
